TERMS AND INFORMATION

TERMS OF PAYMENT—1. **Cash Plan:** This plan earns 3% discount and free boxing. On bulky stock, boxing sometimes amounts to 10% or more so this plan earns a total of from 10% to 12% discount. Under this plan we book the order, reserve the stock until September 1st for Fall shipments and March 1st for Spring shipments. Bills are due on these dates and remittances should be received by September 1st, or March 1st to earn the discount. 2. **Partial Payment Plan:** Whereby one-third amount of order is remitted in advance and the balance goes forward Freight or Express C. O. D. payable at destination. 3. **Charge Account Plan:** Goods will be shipped on charge account to customers of approved credit who supply satisfactory trade and bank references allowing time for investigation. Terms, 30 days net.

SHIPPING SEASONS—**Fall:** Fall season opens as soon as we have had sufficient rain to put the ground in good condition for digging. Usually this occurs about the middle of September. The Fall season closes about November 15th. After that date the weather is usually very uncertain and ground liable to freeze solid. **Spring:** Spring season opens as soon as the frost is out of the ground, usually about April 1st, so we can start to dig, continuing until early May. By this date all stock is too far advanced in growth to take up and transplant successfully.

PRICES—Are limited to Spring, 1936, and supersede all previous lists and ARE SUBJECT TO CHANGE WITHOUT NOTICE.

RATES—Five of same variety and size at the ten rate. Twenty-five of the same variety and size at the 100 rate. Two hundred and fifty of the same variety and size at the 1,000 rate.

BOXING AND PACKING—Boxing and packing will be charged for at actual cost of material used except on cash orders. We make no charge for delivery to railroad station.

SPECIAL NOTICE—Correspondents are requested to use their printed business letter-heads. This list is for the trade only and in justice to our trade customers we use every possible effort to limit distribution of trade prices to those we know to be entitled to receive them.

LOCATION—We are situated in Northern Illinois, on well drained, rich, fertile soil, located 42 miles northwest of Chicago. Visitors are always welcome. Complete directions for reaching Nursery are on back cover.

SALES HELPS—"Conifer Comments," 72-page booklet of information on planting, culture, etc., 10 cents per copy. Evergreen Plate Book, see page 27.

EXTRA CHARGE FOR PERSONAL SELECTION—The prices in this catalog are for first-class stock, fully up to grade and as represented. Customers who wish to make personal selection and tag trees in the nursery may do so at an extra charge.

We accept all orders upon condition that they shall be void should any injury befall stock from causes over which we have no control. Prices do not include any guarantee as to growth.

Seedlings are in bundles of 50's. xx stock is in bundles of 25's.

Lining Out Evergreens

Seedlings, Grafts, Once and Twice Transplanted Sizes

Well-grown lining out stock of first-class Evergreens is very scarce. Your needs should be covered at once to insure delivery of any of the items covered in this assortment. The Juniper grafts are all grown on Juniper understocks. The other items are either seedlings or once and twice transplanted as indicated. 25 of the same variety and size at the 100 rate; 250 at the 1000 rate.

Abies arizonica
(Cork Fir)

Abies concolor
(White Fir)

FIRS

Abies arizonica (Cork Fir)

Specimens of this tree have been growing on our grounds at Dundee for the past twenty years, and have never shown any winter injury. It is, however, little known and not often seen in nurseries. It is a remarkably beautiful and striking Fir of slender habit, reaching considerable size when full grown. Foliage is of a bright blue, easily mistaken at first glance for Colorado Blue Spruce. The underside of the needles is pale blue or whitish. It gets its name from the corky nature of the bark, which in older trees is of a light, creamy color. This tree is native to a limited area in the northwestern part of Arizona. A much less desirable type, *Abies lasiocarpa*, is sometimes offered as Arizona Fir. The trees listed below are guaranteed to be the genuine Arizona Fir. This is one of the few dependable Firs which deserves greater recognition.

8-10 inch xx	Twice Transplanted	\$	\$	\$15.00	\$
10-12 " xx	" " " " " "	20.00

Abies concolor (Concolor or White Fir)

This tree is by far the most outstanding of the true Firs, as it is able to grow contrary to the habit of most Firs, in hot climates, and it also does remarkably well in localities having severe cold weather. In its native range it extends over an extensive area and shows a great variation in character. The trees offered here are grown from seed collected in Colorado, which insures a very superior strain than seed from localities further south. Concolor Fir is an irregular growing tree when small, but after it reaches a height ready for selling to the retail trade, it develops a symmetrical growth. Some specimens are quite bluish in color, others being of greenish tint. In ornamental plantings it seldom reaches more than fifty feet in height, and develops a wide spread of branches. Concolor Fir in the Middle West is a more satisfactory tree in old age than the Spruces.

Gingko Biloba (Maiden Hair Tree)

Popularly so named because of the resemblance of the leaves to the Maiden Hair fern. One of the oldest trees in existence. Leaf bearing yet botanically belonging to the conifers. A slow-growing and long-lived tree, well suited to city conditions.

JUNIPERS

Juniperus chinensis (Chinese Juniper)

Because of the many interesting types which develop from seedlings of Chinese Juniper, an extensive planting of seedlings will provide nurserymen with many interesting types. This is a rapid growing family of Junipers, native to Japan and China. It is also the mother plant of Pfitzer Juniper and some others. The needles are unusually sharp and prickly, bright green or slightly bluish. It thrives in hot, dry locations and will also do well in localities having extremely cold weather. The seedlings at the price offered here give nurserymen a real opportunity to replenish their stock of upright growing Junipers at very small expense.

------------------------	---------	---------	---------	----------

Juniperus chinensis
(Chinese Juniper)

Juniperus chinensis pfitzeriana (Pfitzer Juniper)

Pfizer Juniper

So well known is this tree that it scarcely needs any comment or description. It is a popular variety in every locality of the United States, growing equally well in the extreme north or the extreme south. It is a rapid grower, with graceful plume-like, bluish-green foliage. The balled and burlapped sizes quoted are of rather low habit of growth, and have been staked slightly. The size quoted is the diameter of the tree. The two larger sizes listed have been trained upright to a height of about three feet. We have these trees available in carload lots. All of this stock has been transplanted and root pruned at two-year intervals, so that trees have a well developed root system.

Juniperus chinensis pyramidalis
(Column Chinese Juniper)

Juniperus chinensis pyramidalis blue (Column Chinese Juniper)

This introduction by the United States Department of Agriculture has quickly won a place in American nurseries. It was found in China by the late F. N. Meyer. The growth of this tree is very narrow as compared to Chinese Juniper. It is necessary, however, to trim it frequently, especially when small, in order to give it the extremely narrow form. There are two distinct colors in this tree, which all nurserymen do not recognize. The blue form is the type which is favored by most planters, although the green form is also in good demand. This is a very fast growing tree, a feature which adds to its popular appeal. It may also be trimmed into broader and bushier specimens if desired.

Juniperus chinensis sargentii green (Sargent Juniper)

This popular creeping tree was introduced to the Arnold Arboretum by Prof. Sargent about forty years ago. Ernest Wilson in his "Conifers and Taxads of Japan" has given it a strong recommendation as follows: "It has proved perfectly hardy, grows freely and its stems and branchlets overlap one another in such a manner as to form neat, low, wide-spreading masses of green. As a ground cover this Juniper is the most valuable of all the known kinds."

It grows not more than eight to twelve inches high, but spreads out and creeps along the ground to a considerable distance. Because of its attractive green color and its thrifty and robust nature, it makes an outstanding tree of its type.

Juniperus communis depressa
Vase Shaped Form

Juniperus chinensis sargentii
(Sargent Juniper)

Juniperus communis hibernica
(Irish Juniper)

Juniperus communis depressa plumosa
(Andorra Juniper)

Juniperus communis depressa vase shaped (Vase Shaped Juniper)

This tree overcomes to a large extent the objectionable features of the seedling types. It does not develop the dead branches so often found in the seedling forms, and because of its more regular compact growth, has entirely replaced the common Juniper in the Hill Nursery. Larger quantities including lining out sizes, will be available in the future.

2-2½ "	xxx	" " " " " "	B&B 1.75	15.00

Juniperus communis depressa aurea (Golden Prostrate Juniper)

This is an old, well known form, among the brightest golden colored of all Evergreens. It originated many years ago in the old Douglas Nurseries at Waukegan, Illinois. It is a low grower, having many semi-erect, spreading stems. This tree gives the desired variation in color to foundation groups and other plantings where trees of dwarf form are needed.

1½-2 "	xxx	" " " " " "	B&B 2.00	17.50

Juniperus communis depressa plumosa (Andorra Juniper)

This is a comparatively new variety, discovered in 1907 in a shipment of wild seedlings of Prostrate Juniper collected in Maine and sent to the Andorra Nursery in Philadelphia. The tree, however, bears very little, if any, resemblance to Juniperus communis, it has more of the characteristics of the Juniperus sabina. Its main distinction is the unusual purplish coloring of the foliage when frost comes in the Fall. During the Spring and Summer it is of a grayish green color. It grows to a height of about fifteen to eighteen inches. Sometimes it stays very closely on the ground, raising only to a height of six or eight inches. The name Juniperus horizontalis var. plumosa is recommended by Dr. Bailey.

Juniperus japonica
(Japanese Juniper)

JUNIPERS (Continued)

Juniperus communis hibernica (Irish Juniper)

One of the oldest of the horticultural varieties of Evergreens, widely known and planted throughout the country. It has a unique habit of growth, very columnar and formal in outline, reaching six or eight feet in height and not more than twelve to eighteen inches in diameter. Because of the structure of this tree, which instead of a single stem has numerous upright branches growing from the base, it is sometimes injured by snow and ice. It is not hardy in the extreme north and frequently suffers from damage to the tips of the branchlets during severe cold weather. This is a tree in strong demand throughout the entire nursery trade. Every nurseryman should have a stock of it.

Juniperus japonica (Japanese Juniper)

This tree is doubtless one of the most familiar of prostrate or creeping Junipers. It is a vigorous grower, with wide-spreading procumbent branches, closely covered with bluish-green, sharply pointed leaves. Under favorable conditions it reaches up to fifteen feet in diameter, but can be confined to a small area by trimming. It will stand considerable shade, and also does well in the hot sun. A good variety for terraces, hillsides, and rock gardens. It was for many years known as *Juniperus chinensis procumbens*.

We allow 3% discount and box free when cash accompanies order.

JUNIPERS (Continued)

Juniperus japonica nana
(Hill Japanese Juniper)

Hill Japanese Juniper
(Juniperus japonica nana)

In a shipment of Japanese Juniper which we imported from Japan more than twenty years ago, the original plant of this variety was found. It is similar in every respect to the Japanese Juniper, except in its extreme dwarf form. It grows in a solid mat with much finer needles more closely set together. Its growth is very slow. It, therefore, has a distinct advantage over the common type for use in rock gardens and other areas where it is important to have trees of extremely small size and slow growth.

		Each	10	100	1000
18x18 inch xxx Three Times Transplanted	B&B	\$2.00	\$17.50	\$	\$

Juniperus sabina (Savin Juniper)

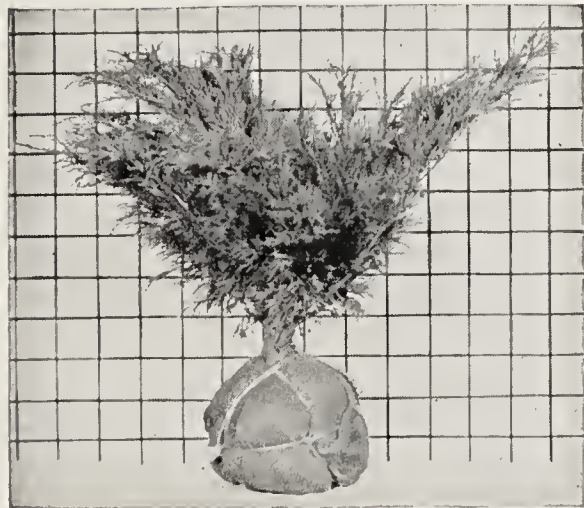

This is one of the older, more familiar forms of dwarf Juniper. It makes a low, bushy plant, having many branches growing in a semi-erect manner from the base of the tree. It is native of mountainous regions of Europe. It is one of the oldest known ornamental Evergreens, as mention of it is found in old books of reference nearly 400 years ago. It has certain medicinal properties, which no doubt, accounts for its wide use in former times.

4- 6 inch xx Twice Transplanted.....			8.00	60.00
8-10 " xx " " "			15.00	130.00

Juniperus sabina von ehron (Von Ehron Juniper)

Although not so well known as some of the varieties of Savin Juniper, this tree has been in good demand in recent years. It is a very fast growing form, often making a faster growth than the Pfitzer Juniper. It grows in a low, bushy habit, somewhat resembling the Savin Juniper. It has less tendency to develop the objectionable dead branches that sometimes occur in the Savin Juniper. It has a deep, rich, green color.

Juniperus virginiana cannarti
(Cannart Redcedar)

Juniperus virginiana
(Redcedar)

Juniperus virginiana elegantissima
(Gold Tip Redcedar)

Juniperus virginiana (Redcedar)

This Juniper is one of America's best known Evergreens. It is found growing in native stands over a large part of the North American continent and very likely found in every state east of the Rocky Mountains. It is, therefore, natural that the many different conditions under which it grows have produced an extensive variation in the characteristics of the trees from different localities. The strain which we offer here is a close-growing, compact type of distinct pyramidal form. In the balled and burlapped sizes listed below are many distinct types of foliage, many which resemble some of the best known horticultural varieties of this tree.

Redcedars require an open, well drained, sunny location for best development. The seedlings quoted here are suitable to plant in pots and grow on for future use as understocks.

3- 4 " xxx Three Times Transplanted.....B&B	2.00	17.50	150.00

Juniperus virginiana cannarti (Cannart Redcedar)

The leading form of Redcedar, having deep rich green, heavily tufted foliage, keeping a fine green winter color. It makes a pyramidal specimen of middle size, reaching 15 to 20 feet. It can be readily trimmed and thus maintained at any size wanted. If left untrimmed, the growth is more or less open, but none the less pleasing. Some trees bear blue and silver berries which adhere late in Autumn and are greatly enjoyed by the birds. An absolutely hardy tree, propagated usually by grafting.

3½-4 " xxx " " " ".....B&B	3.00	27.50

Juniperus virginiana elegantissima (Goldtip Redcedar)

Here is a tree that will give variation to the green and blue colors of other Evergreens. It is rather broad and bushy, with slightly drooping foliage. In the spring when the new growth comes out it is a rich creamy golden color on the tips, gradually darkening to old gold color as the season progresses. Unless kept low by trimming, it will grow 10 feet high or more. It has the characteristic Juniper foliage, soft and lacy, easily trimmed. It is most attractive when used in combination with some other variety.

15-18 inch xx Twice Transplanted.....B&B	.75	6.50	50.00
--	-----	------	-------	-------

Juniperus virginiana glauca
(Silver Redcedar)

Juniperus virginiana kosteri horizontalis
(Koster Juniper)

JUNIPERS (Continued)

Juniperus virginiana glauca (Silver Redcedar)

Best known, no doubt, of the horticultural varieties of Redcedar. Its outstanding feature is the silvery blue color, brightest in Spring, darkening somewhat during the season. The new growth is almost whitish in appearance. Can be easily trimmed and made to grow in a formal shape. It is an upright grower of medium size, reaching upwards to fifteen feet or more. It grows over a wide latitude and is a great favorite in the south as well as in the northern sections of this country.

We grow our trees of this variety only on Juniper understocks. Some inferior trees are on the market grafted on biotas and some are being offered grown from cuttings. Only by obtaining stock grafted on Juniper understocks can you be assured of trees which will develop into satisfactory specimens.

Juniperus virginiana kosteri horizontalis (Koster Juniper)

A low, spreading Juniper, with bluish-green leaves. It has a tendency to produce rather long, stiff branches, giving it a habit rather in between the Pfitzer Juniper and some of the creeping forms. Not so well known, although it is an old variety. Grows rapidly and reaches a considerable size. It has proven satisfactory in any section of the country where Juniperus virginiana varieties are commonly grown.

Hill Pyramidal Juniper

Juniperus virginiana schottii
(Schott Redcedar)

JUNIPERS (Continued)

Juniperus virginiana pyramidalis (Hill Pyramidal Juniper)

Some of our customers report to us that they consider this tree the very finest of all the pyramidal types of Junipers. It is a selected form of the Redcedar reproduced by grafting. Foliage is rich green in color and it does not discolor in the winter as many others do. It is of particular value for trimming into narrow sentinel-like specimens.

Hill Dundee Juniper

(Juniperus virginiana pyramidiformia hilli)

One of the most interesting trees produced in the Hill Nursery in recent years is the Hill Dundee Juniper. Nurserymen on the alert for new and interesting trees have been eager to secure stock of this new tree. It is bluish-gray in the Spring and Summer and it changes to a plum-like color in the Fall and Winter. This is not the bronze color of the Redcedar, but a very unusual plum-like shade which is entirely different from any other Evergreen. To create new interest in your Evergreen plantings and to keep your stock up-to-date you should include this most excellent new Juniper. While it is of recent introduction to the trade, we have had plants tested in different localities for the past ten years so offer it with full assurance of its satisfactory development.

Larix europea (European Larch)

This tree should not be confused with the American Larch, our native swamp tree. The European Larch grows on a high ground and is quite different in character. A few of these trees are always in good demand in the nursery because of the attractive light green color when the new foliage develops in the Spring, and the beautiful golden shade which the tree assumes after frost in the Fall. This is one of the very few deciduous conifers.

SPRUCES

Black Hills Spruce

(*Picea canadensis albertiana*)

The Black Hills Spruce is the hardest of all Spruces, symmetrical, compact and bushy of growth, in fact, the very smallest trees grow round, sturdy, and compact. As the tree grows and develops, it continues to carry this particular style of growth and generally becomes the most compact-growing specimen of the Spruce family; even in old trees the lower branches are retained, thus forming a close ground cover. Botanically, the Black Hills Spruce is considered a close relative of White Spruce, having developed its distinct characteristics through long centuries of living in the Black Hills of Dakota. The foliage varies from green to a bluish tint, and all trees are remarkable for their bright, fresh color. Black Hills Spruce was first introduced to commercial culture by Mr. D. Hill many years ago and has since become widely planted throughout the country.

Picea excelsa
(Norway Spruce)

Picea excelsa nidiformis
(Nest-shaped Spruce)

SPRUCES

Picea excelsa (Norway Spruce)

For many years Norway Spruce has been highly appreciated because of its rapid growth, its thriftiness, and its heavy masses of deep green foliage. Some of the finest old hedges are of Norway Spruces, as the trees can readily be pruned to any desired height. On farms and around homes all over the country, Norway Spruce windbreaks are giving substantial protection to stock and buildings. Norway Spruce is a tall, picturesque, and hardy tree, graceful in all its lines, and well adapted to planting over a wide range of territory. As the Norway Spruce prevails over a wide range of European territory, here are many sources from which to obtain seed. Careful experiments and close study for many years have proved to us that seed from the higher elevations insures a superior type for America, therefore, we use this seed exclusively.

---------------------------------------	-----	------	------	-------	-------

Picea excelsa nidiformis (Nest-Shaped Spruce)

It was found in cultivation near Hamburg, Germany, and described by the introducer in 1906 as "a round plate-like, fan-forming form with a dense nest-like mass of branchlets where the leading shoot should be."

It is of such extraordinary dense form, so densely branched that one wonders how the light ever gets to the lower branches. Branchlets in tight layers, the whole forming a dense, impenetrable head. It grows slowly, ¾ to 1¼ inch yearly. This is one of the few truly dwarf Evergreens. Ultimate size is a matter dependent entirely upon conditions.

SPRUCES (Continued)

Picea glauca conica (Dwarf Alberta Spruce)

One of the most interesting oddities among Evergreens. It is of extremely narrow, pyramidal growth, thickly covered with short, close set twiggy branches and clothed in grass green leaves. It is unlike any other Evergreens, both in shape and general appearance so that it always attracts attention. The parent tree is in the Arnold Arboretum, at Jamaica Plain, Massachusetts. It was found in the Canadian Rockies at Lake Laggan in 1904 by Mr. J. G. Jack, of the Arnold Arboretum staff. Its annual growth is only one-half inch.

Hill Mugho Pine

HILL MUGHO PINE

(Pinus mughus)

CHOICE DWARF TYPE

For many years the Mugho Pine has been a leading specialty with the Hill Nursery. By obtaining seed from a restricted area in northern Europe, we have been able to produce a type of Mugho Pine very superior to the average trees of this variety. Hill Mugho Pine are many stemmed, branched close to the ground, so that customers are able to grow the true dwarf, compact, form so much in demand.

By further trimming when the trees are small, we produce trees of perfect shape and form. We wish to call particular attention to the very low prices at which we have offered the balled and burlapped sizes. We have an immense stock of these trees. At these rates nurserymen can make an unusual profit in handling this stock.

Several sizes of lining out stock are also offered.

Japanese Spurge (*Pachysandra terminalis*)

A broad-leaved Evergreen plant growing six to eight inches high and forming a close mat-like growth, formed by planting several plants close together.

When used as an underplanting, it gives finish to your plantings of shrubs, trees and flowers, by covering the bare soil. It helps Evergreens to conserve moisture when planted beneath them, furnishing more of a natural forest condition. It is good for growing on banks and terraces, its fibrous roots and creeping stolons help to hold the soil. It is an excellent plant for a low border along drives and walks. It is an ideal plant for window boxes both winter and summer. It is just the thing for bare spots under trees where grass will not grow. It makes a beautiful and perpetual covering for graves in cemetery plantings. It thrives in city yards under smoky conditions. Bulbs may be planted in it. It is also an interesting plant in a rock garden. It is perfectly hardy under all conditions, stands severe freezing without discoloring. It has a bright green, attractive foliage.

------------------------------------	------	-------

Pinus nigra
(Austrian Pine)

Pinus ponderosa
(Ponderosa Pine)

PINES (Continued)

Pinus nigra (Austrian Pine)

This is by far our best selling upright growing Pine. The leaves are two in a sheath, straight and slender, from 4 to 5 inches long, and of such a deep, rich green color that it is known in some parts of the world as the "Black Pine." Few trees show such remarkable resistance to the trying conditions of city planting. Coal, gas and smoky atmospheres have little effect on its growth. It is a tree equally satisfactory for seashore planting and for the inland country. In old trees planted in the open, the diameter of the branch-spread often nearly equals the height of the tree, but in the native forests of Austria and other parts of Europe it makes a tall tree often over 100 feet high. Annual growth has been observed to be, under favorable conditions, 18 inches or more.

Pinus sylvestris
(Scotch Pine)

Pinus tanyosho
(Japanese Table Pine)

Pinus sylvestris (Scotch Pine)

The well-known tree, though tall, seldom grows straight, and the branches shoot out rather obliquely. In old trees the bark is rough and cracked and reddish in color, and the leaves are short, pungent, concave on the upper surface, convex on the under, and of a pale green color. This is the common Pine of Europe where it has been a valuable tree for timber and ornament for centuries. It is familiarly known in Scotland as "Scot's Fir." The rapidity of growth, great hardiness, and the facility with which it may be grown on almost all soils, has rendered this tree a great favorite. However, it prefers a cool, gravelly subsoil that is well drained, and will then form a handsome tree. It always inclines more to the picturesque than to the beautiful. We obtain our seed from Sweden where the best form grows, exactly suited to American conditions.

Douglas Fir

(Pseudotsuga douglassi)

This is the outstanding tree of its type for the middle west. Transplants very readily. Is free from diseases, is able to withstand extremes of winter and summer temperatures and develops into a majestic tree with beauty improving with age.

There are two distinct forms of Douglas Fir—one the dark green, gigantic-growing timber tree of the northwestern Pacific Coast area, and the other type from Colorado. The latter variety is the one recommended, both for its hardiness and its great beauty. The typical form of young trees is an open, broad, sharp-pointed pyramid; the lower branches are straight or somewhat drooping, and the middle or higher one trend upward.

Douglas Fir grows rapidly. Its general outline is more graceful and less stiff than the Spruce. Foliage is soft and fragrant. Our plants are the type from northern Colorado, the seed being collected in deep gorges of high altitudes, where the blue and silvery foliage is characteristic. The growth is compact and symmetrical with rather short needles, in contrast to Southern Colorado and New Mexico types which are of doubtful hardiness, irregular, and open-growing. It reaches sixty feet or more in height, with a spread of branches twelve to eighteen feet. It is a rapid grower and thrives well in almost any situation. Plant with plenty of room for future development.

Japanese Yew (Upright Type)

Taxus cuspidata (Japanese Yew)

The Yews are fast becoming popular in America, both for their fine shiny waxy foliage and ability to stand various planting conditions, including dense shade. This valuable Yew has been cultivated throughout Japan from time immemorial, and introduced into America many years ago, having taken its place as one of the most noteworthy and valuable on the entire list. Originating in the cold, high altitudes of Northern Japan from where we obtain our seed, it is found fully able to successfully withstand extremes of heat and cold in America. Grows close, upright and compact. Foliage dark green, fruit bright scarlet. The development of the trees depends upon growing conditions but as it can be very easily trimmed it is suited for almost any landscape need.

Taxus cuspidata (Spreading Japanese Yew)

When grown from seed the Japanese Yew develops a single stem and grows in the manner shown in the picture above. However, when grown from cuttings, it develops a broad, low, bushy form as pictured below. This form, of course, has many valuable uses in landscaping. The strain which we offer is one of particularly rapid growth and compact close-growing habit. It has a rather light green foliage as compared to some of the Yews. All forms of the Japanese Yew are of unusual hardiness, making it a valuable and dependable tree for almost any section of the country, except in the extreme south.

Japanese Yew (Spreading Type)

Taxus media hicksi (Hicks Yew)

A variety with vertically growing branches, making a narrow outline of rich, deep green foliage. It is a variety of the Japanese Yew discovered in the Dana Arboretum at Glen Cove, Long Island. Like all varieties of the Japanese Yew, this tree is thoroughly hardy, will stand severe cold, and will thrive in the shade. Not a common tree as yet in the middle west, but one which is gaining friends fast. Its growth is quite rapid, its ultimate spread of branches very narrow, height perhaps 10 to 12 feet. Can be easily trimmed.

**Taxus cuspidata pyramidalis hilli
(Hill Pyramidal Yew)**

This tree was introduced several years ago by the Hill Nursery. It is outstanding both in the extremely heavy dark green foliage, which resembles Dwarf Japanese Yew, and in its habit, which is tall and very narrow, somewhat like Hicks Yew in appearance. This is a selected type of Japanese Yew of outstanding merit.

Taxus cuspidata intermedia (Intermedia Yew)

Spreading form. Dense foliage, compact grower, very deep waxy green. By far the best of the spreading varieties for both color or form.

12x12 inch xx	Twice Tran.	B&B	.75	6.50	50.00
---------------	-------------	-----	-----	------	-------

Taxus cuspidata nana (Dwarf Japanese Yew)

This tree fills a unique place among Evergreens. It has a low, peculiar, irregular and picturesque outline. Old trees assume the billowy outline of old boxwoods and offer to planters in colder climates some of the charm which old boxwood trees possess.

The branches are covered with little bunches of blackish-green foliage. The color is retained throughout the season, which gives it an added advantage over many forms of Evergreens. The foliage is very heavy and of a waxy, shiny, green color.

(Dwarf Japanese Yew)

Intermedia Yew

Thuya occidentalis
(American Arborvitae)

Thuya occidentalis douglasi
aurea
(Douglas Golden Arborvitae)

ARBORVITAE

Thuya occidentalis (American Arborvitae)

A moist location is preferred. Stands trimming well, and for this reason is widely used for hedge purposes. It usually grows bushy at the bottom and tapering toward the top. Foliage is very soft and lacy and of shiny deep green color. We are careful to obtain our seed from certain sections of northern Wisconsin, producing stock of good green color, and compact habit of growth.

The American Arborvitae is the mother tree from which more than fifty varieties have been developed, varying in color from deep green to bright golden and ranging in size from little dwarfs to tall, pyramidal specimens. The native forests of Arborvitae have long been of great commercial value for timber, producing tall, straight trunks much used for telegraph poles.

Thuya occidentalis douglasi aurea (Douglas Golden Arborvitae)

It forms a broad, bushy, pyramid, very similar in outline to a good type of the regular American Arborvitae. The foliage is decidedly golden, very bright in the Spring and keeping its color well. The bright golden color is best displayed when planting this variety with a background of darker shades of green. It grows in any ordinary good soil and does especially well in moist cool locations.

Among the golden forms, the Douglas Golden Arborvitae is well known and widely used. It is a form originated by Robert Douglas of the old Douglas Nurseries at Waukegan, Illinois.

Thuja occidentalis pyramidalis
(Hill Pyramidal Arborvitae)

Thuja occidentalis wareana
(Ware Arborvitae)

Tsuga canadensis
(American Hemlock)

ARBORVITAE (Continued)

Thuja occidentalis pyramidalis (Hill Pyramidal Arborvitae)

Of dense, compact growth, narrow and pyramidal in form, deep rich green color, uniform habit and hardiness to withstand conditions here in the northern states. It reaches a height of 15 to 20 feet and usually measures not more than 2 feet in diameter at the base. With few exceptions, it has but one main stem, which makes it less liable to damage from snow.

Thuja occidentalis wareana (Ware Arborvitae)

A symmetrical, compact grower, very long lived. Raised by and named for Mr. Thomas Ware, an English nurseryman, who produced it about 1850. It matures at 6 to 8 feet. It is conical in outline and covered with dark green foliage which is somewhat different from the American Arborvitae, being much heavier and deeply crested. The branches are short and stiff.

Tsuga canadensis (American Hemlock)

"Most graceful of all Evergreens" is the title so often bestowed on the Hemlock. Certain it is that few Evergreens can claim the charms of this tree, both in youth and in its elder years. Its long branches droop gracefully to the ground, and the branchlets bend willingly to the breeze. The common shape of the tree is conical, tapering evenly from a broad base to a long, straight, thrifty shoot. Most trees have a single main stem, but low, wide-spreading trees may have several stems.

Hill's Evergreen Plate Book

Only \$3.00 and \$3.75 Postpaid

Ideal Loose-Leaf Cover

This is a book designed for the use of salesmen. It represents the leading varieties of evergreens in their natural colors, both individual trees and groups. It is the only book of its kind to be had anywhere. Many of the leading nursery firms have been using it for several years. Anyone wishing a copy for inspection will receive one if they will forward their check for \$3.00. If it is not what you want you may return it and we will refund your money.

There are fifty, four-color process plates, made from actual photographs, colored in natural colors and printed on substantial paper. The size of the binder is 5½ x 9", loose-leaf style. Bound with cloth covers, the price is \$3.00 postpaid. Bound with genuine leather cover, \$3.75 postpaid. There are fifty plates of evergreens.
